App for Companion Planting

Michael Kleinschmidt

We use tech to connect human potential and opportunity with dignity & humility

Goal of the project

Companion Gardening or finding good or bad neighbours for vegetables

The idea that plants benefit of each other by *companion gardening*:

by attracting beneficial insects, repelling pests or providing nutrition.

So if you have many different plants the question is how to arrange them at the vegetable patch.

For example:

- onions like carrots but doesn't like peas
- peas like carrots but doesn’t like onions
- carrots like onions and peas
- → arrangement with carrots in the middle

Code and Webpage

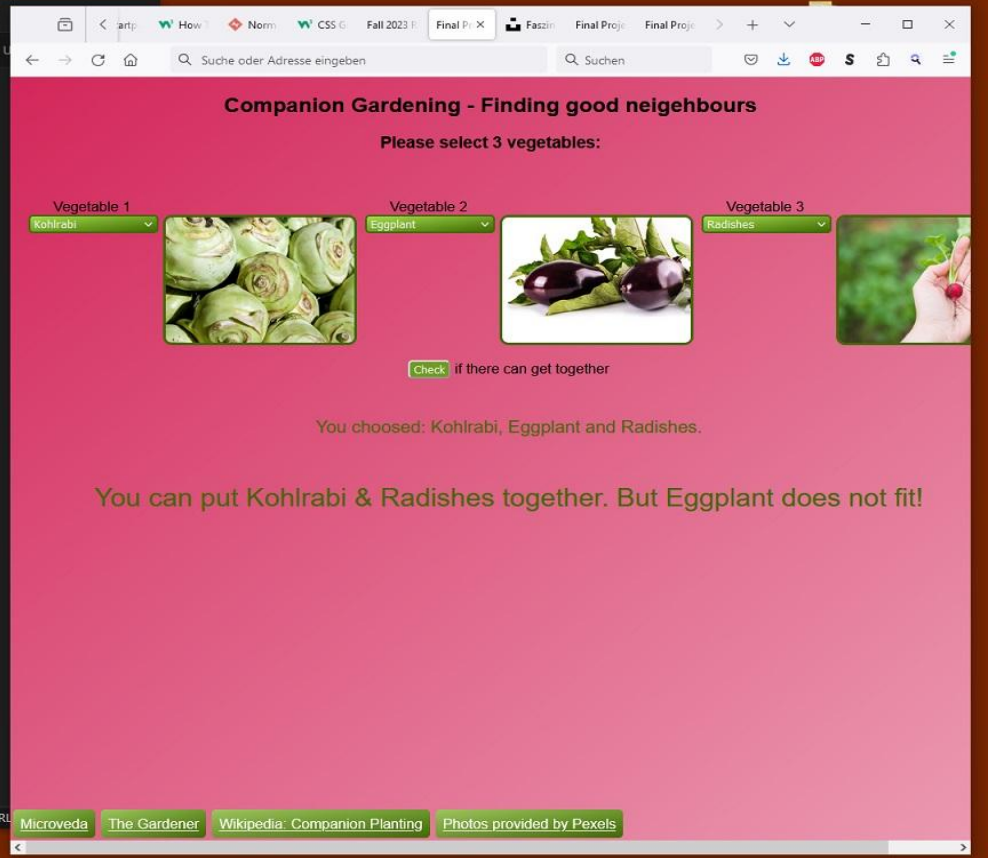
```
let goodneighbours = window.goodneighbours;
let badneighbours = window.badneighbours;
let keysOfGoodneigbours = Object.keys(goodneighbours);
let keysOfBadneigbours = Object.keys(badneighbours);
keysOfGoodneigbours = keysOfGoodneigbours.sort();
keysOfBadneigbours = keysOfBadneigbours.sort();

let keysAllVegUnsorted = keysOfGoodneigbours.concat(keysOfBadneigbours);
let keysAllVegSorted = keysAllVegUnsorted.sort();
let keysWithoutDuplicates = [];

function removeDuplicates(data) {
    data.forEach((value) => {
        if (!keysWithoutDuplicates.includes(value)) {
            keysWithoutDuplicates.push(value)
        }
    })
}
removeDuplicates(keysAllVegSorted);
console.log(keysWithoutDuplicates);

function createDropdown(elementId) {
    let dropdown = document.getElementById(elementId);
    let options = keysWithoutDuplicates;
    for (let i = 0; i < options.length; i++) {
        let opt = options[i];
        let ele = document.createElement("option");
        ele.textContent = opt;
        ele.value = opt;
        dropdown.appendChild(ele);
    }
}
createDropdown("selectVegetable1");
createDropdown("selectVegetable2");
createDropdown("selectVegetable3");

function showChoice(veg1, veg2, veg3) {
```



Key Learnings

Using VSCode, Javascript, HTML, CSS

- Building a webpage with HTML, CSS
- Getting user input on a html-page
- Putting result back to html-page
- Building a logic with Javascript and using Functions, Objects, JSON, DOM and API

Continue the project

To do´s

- Building a better html-page → other design, responsive design
- Finding and resolve bugs
- Extand the functionality: more vegetables, visualisation of the result, etc.
- Improve the code (slim, alternative solutions, readability)

Credits

Thank you teachers and classmates for

- First steps into javascript
- Showing us tools to work with
- Helping, motivating and encourage us
- A good and respectful learning environment
- Your time and effort and
- The good time :-)

Thank you!
